

Dissertation dev log

Week 12:

Current Goals for prototype session:

Current Stretch goals for prototype:

- Voronoi clipping implemented
- A way to interact with the fragmented mesh
- An implementation in GLSL, for performance comparison

Completed:

- A working Voronoi fracture in 2D for demonstration
- Working Voronoi fracture in 3D
- Comprehensive background done, covering triangulation, fracturing methods used in games, Graphics API's, Performance of Graphics API's, Point sampling, and Voronoi Clipping.
- Clearly stated research question
- Clear, feasible hypothesis, that is well scoped.
- An introduction that provides clear context for the project, and explains the need for the research, including positive impacts and who benefits. It should also highlight the motivation for the project.
- Professional, ethical, sustainable, legal, and social review carried out.
- A plan for security and privacy concerns has been written, and data is well managed.
- A methodology for how the project is going to be researched, and how its going to be evaluated
- A working way of profiling the results of the prototype
- A Critical Review of current technology is completed, that highlights where the gap in research is, and the how this project fills it.
- Project is ethically robust
- Project plan with gantt chard
- Profiling results that are easily replicated and are well documented.
- Fracture implemented in both OpenGL and Vulkan
- Readme that highlights development roadmap

Development notes:

License added. I went with apache 2.0 due to it being open source, only needing to credit the license holder, and mark any changed files as different. The dissertation has been cleaned up, with some changes made to quality assurance, adding standard readability checks like lines of code, maintainability index, and cyclomatic complexity.

Not many challenges faced this week, except grammar, and cleaning the git. Ready for submission!
