

Dissertation dev log

Week 15:

Current Goals for Full Dissertation session:

- Voronoi clipping implemented
- An implementation in GLSL, for performance comparison
- Research question made more precise and naturalistic
- Workplan make clearer
- Gather data
- Analyse data
- Specification for computing artefact that integrates societal, user, and business needs, demonstrating impact, usability and values to stakeholders
- Design rational, usage guidance, maintainability and architecture overview are provided
- Abstract
- Results and analysis section
- Discussions and conclusion
- Statistics addendum
- Artefact testing
- Critical addendum

Completed:

- A way to interact with the fragmented mesh
- A working Voronoi fracture in 2D for demonstration
- Working Voronoi fracture in 3D
- Comprehensive background done, covering triangulation, fracturing methods used in games, Graphics API's, Performance of Graphics API's, Point sampling, and Voronoi Clipping.
- Clearly stated research question
- Clear, feasible hypothesis, that is well scoped.
- An introduction that provides clear context for the project, and explains the need for the research, including positive impacts and who benefits. It should also highlight the motivation for the project.
- Professional, ethical, sustainable, legal, and social review carried out.
- A plan for security and privacy concerns has been written, and data is well managed.
- A methodology for how the project is going to be researched, and how its going to be evaluated
- A working way of profiling the results of the prototype

- A Critical Review of current technology is completed, that highlights where the gap in research is, and the how this project fills it.
- Project is ethically robust
- Project plan with gantt chart
- Profiling results that are easily replicated and are well documented.
- Fracture implemented in both OpenGL and Vulkan
- Readme that highlights development roadmap
- OpenGL integrated into bridge system

Bugs

- With plane clipping, when using 1000 points, some of the cells seem to randomly grow then shrink in size, could be due to the rendering engine, rather than Voronoi
- OpenGL buffering of data has to be done in a specific order, i.e., declare positions, then buffer it, then declare textures, and then buffer them
-

Development notes:

A problem with the clipping was causing the pole to disappear, it has been fixed now. Clipping the whole cell has proved difficult, so work on other features has been finished instead. OpenGL is now integrated with Vulkan, allowing easy switching of API. The problem with clipping is that it is difficult to find which cells are inside, or clipping with the mesh. And then clipping them against the triangles is not working properly, it seems to work, but is always off, like it has shrunk the cell.
